# THE Cotton SITUATION

BUREAU OF AGRICULTURAL ECONOMICS  
UNITED STATES DEPARTMENT OF AGRICULTURE

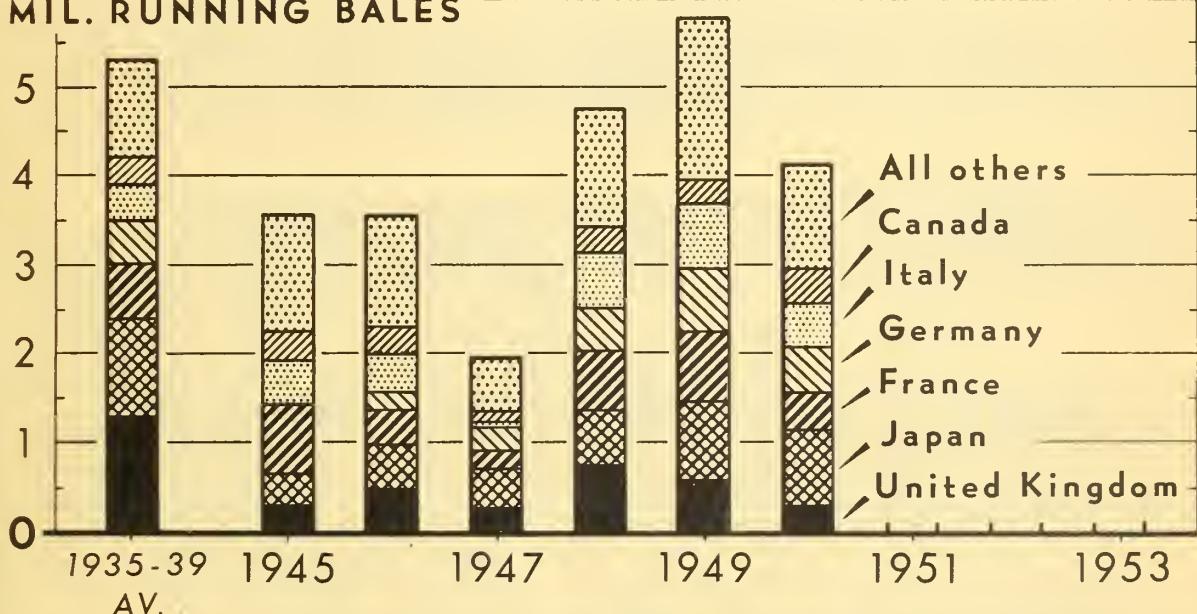

CS-136

BAE

SEPTEMBER 1951

## EXPORTS OF U. S. COTTON 1935-39 and Postwar

MIL. RUNNING BALES

COMPILED FROM REPORTS OF THE BUREAU OF THE CENSUS  
DATA FOR 1951 ARE PRELIMINARY

YEAR BEGINNING AUGUST

U. S. DEPARTMENT OF AGRICULTURE

NEG. 48310-XX BUREAU OF AGRICULTURAL ECONOMICS

Exports of cotton from the United States in the past season amounted to 4.1 million bales, still 3 times the 1940-44 average, but 22 percent below the 1935-39 average.

Exports to Canada reached an all time high of nearly 0.5 million bales and Japan's takings were almost to their 1935-39 level of 1.1 million bales.

Italy's 0.5 million bales were, except for 1948 and 1949, the highest for nearly 20 years. The United Kingdom took 23 percent of the prewar average and about half of the quantity shipped last year.

Exports to "other countries" shifted from 20 percent of the total in the prewar period to 28 percent last season.

THE COTTON SITUATION

Approved by the Outlook and Situation Board, September 19, 1951

SUMMARY

Cotton prices declined during August and then began to move slowly upward in September. The decline in prices reflected the larger supply of cotton which will be available this crop year. The rise in price was caused in part by removal of restrictions on the quantity of exports and by the current disposition of farmers to hold their cotton in view of present market conditions.

On September 5 the average ten spot market price for Middling 15/16 inch cotton was 34.10 cents per pound, the lowest since June 30, 1950. By September 19 this price had risen to 34.76 cents. Some of the more distant futures months are quoted at higher prices than the nearby months. For example, on September 19, October futures at New York closed at 35.00 cents while March 1952 futures closed at 35.18 cents. The price received by farmers for cotton was 34.60 cents on August 15, 1951, 8.57 cents below the record high of 43.17 cents on April 15, 1951, while the parity price remained at the July 15 level of 33.85 cents. The loan rate this season is 31.71 cents a pound for Middling 15/16 inch cotton at average location.

In contrast to last year when only about 8,000 bales were placed in the Government loan, farmers are expected to place considerable quantities under loan with the Commodity Credit Corporation by the time this year's crop is completely harvested. Most of this cotton will probably move out of the loan by next summer.

The September 10 report on the cotton crop estimates production at 17,291 thousand bales of 500 pounds, about the same as the August 8 report. Acreage for harvest is put at 28,544,000 acres. Based on this report, the August 1 carry-over of about 2.2 million bales and imports of 200 thousand bales, the cotton supply in the United States during 1951-52 is estimated at 19.5 million running bales.

The average daily rate of domestic mill consumption of cotton in August was 37.7 thousand bales, compared with 32.0 thousand in July. The August figure is 6.7 percent less than consumption during August 1950.

Exports during July were 129.1 thousand bales, bringing the total for the year beginning August 1, 1950, to 4.1 million bales, or about 29 percent less than in 1949-50. Virtually all restrictions have now been removed from the export of cotton to friendly countries. Lint cotton was placed under general licensing on September 17 and open-end allocations were established for linters on September 10.

The 1951-52 world cotton supply is now estimated at about 47 million bales. This is approximately 7 percent more than the world supply last year, and about 42 percent more than last year's record world

disappearance of 33.2 million bales. While no official estimate of 1951-52 world cotton consumption is yet available, the International Cotton Advisory Committee has estimated an increase in world carry-out stocks this year of only 3 million bales.

Prices of cotton textiles in the United States have decreased and during August the prices of 17 constructions of grey goods averaged about 6.31 cents less than in July. Mill margins, the spread between the price of a pound of cotton and its approximate cloth equivalent, have decreased as a result of this large decrease in textile prices.

#### RECENT DEVELOPMENTS

##### Cotton Prices Decline During August but Rise During September

Cotton prices declined during August, but increased gradually during September. On September 5 the average ten spot market price for Middling 15/16 inch cotton was 34.10 cents per pound, the lowest price since June 30, 1950. By September 19 this price had risen to 34.76 cents.

The decline in prices was caused in large part by a larger supply and crop in prospect for 1951, high inventories of cotton goods at manufacturing and other levels, and slack sales of cotton goods. The rise in prices in September was probably caused by an unwillingness of farmers to sell their cotton at present prices, and removal of quantitative restrictions on exports.

Some of the more distant months in cotton futures were quoted above the nearby months. For example, on September 19, March 1952 was quoted at 35.18 while October 1951 closed at 35.00 cents (see table 1).

The price received by farmers for cotton dropped from 39.11 cents a pound on July 15 to 34.60 cents on August 15, compared with the 1950-51 season high of 43.17 cents on April 15, 1951, and 36.95 cents in August 1950. The price received by farmers has thus fallen from the peak of 128 percent of the parity in November 1950 and April 1951, to 102 percent in August 1951. However, this is the second-highest mid-August price on record.

##### Heavy Participation in Cotton Loan Program Expected This Year

As the price of cotton moved lower, it became apparent that by the time the harvest is completed, farmers will have placed considerable cotton under loan. By the end of the season, most of these loans will probably have been repaid by the farmers. The loan rate this year is 31.71 cents a pound for Middling 15/16 inch, at average location, compared with 29.45 cents a pound last year. By September 6, notes covering 28.8 thousand bales of 1951 crop cotton had been received by the Commodity Credit Corporation, as compared with a total of 8,000 bales during the entire 1950-51 season. In 1948, 42,800 bales had entered the loan through September 2 out of total entries of 5.3 million bales. There is some lag between the time the cotton is harvested and the time it is reported under loan, and therefore, more of the 1951 crop cotton has probably been placed under loan than is indicated by the above figures.

Spot Market Sales Below Last Year

From September 1 through September 19 daily sales at the ten spot markets averaged 41,079 bales. This was 29 percent below the average daily rate in September 1950. The daily rate of sales during August 1951 was 25,333 bales compared with 55,878 bales a year earlier. This decrease in spot market activity in the face of much larger ginnings reflects in part a reluctance by mills to buy for future needs and in part the reluctance of farmers to sell their cotton at current prices (see table 2).

Crop Estimate Revised

Slightly Upward

In its second official report on the 1951 cotton crop, the Bureau of Agricultural Economics, on September 10 estimated this year's production at 17,291 thousand bales of 500 pounds gross weight (the August estimate was 17,266 thousand bales). This is about the same as the August estimate. Acreage for harvest is put at 28,544 thousand acres, indicating abandonment of 3.3 percent, compared with the 10-year average of about 2 percent. The indicated average yield per acre is 291 pounds, compared with 287 pounds as of August 1. Estimated acreage and production by States are shown in table 3.

Rate of Harvest High, but  
Quality Somewhat Lower  
Than Last Season

Ginnings of the 1951 crop prior to September 1 were 2,014 thousand bales, a new record high for this period of the season. This was about 18 percent of the indicated crop. By the same date in 1950, 859 thousand bales or approximately 9 percent of the crop had been ginned. Ginnings by States are shown in table 4.

Upland cotton ginned prior to September 1 was lower in grade and shorter in staple length than for the same period of 1950. The grade index for 1951 was 98.8 (Middling White equals 100) as compared with 100.1 in 1950. The average staple length was 33.3 and 32.3 thirty-seconds of an inch in 1950 and 1951, respectively. The quality of the cotton crop is expected to improve as harvesting becomes more general. Grade indexes and average staple lengths by years for ginnings prior to September 1 are shown in tables 5 and 6.

1951-52 Cotton Supply Now  
Estimated at 19.5 Million Bales

Approximately 19.5 million bales of cotton will be available this season for domestic consumption, exports, and carry-over into next season. This supply consists of the August 1, 1951 carry-over of 2.2 million bales, production as estimated above, and a 200,000-bale estimate for imports. The total is 15 percent larger than was available during 1950-51.

Mill Consumption During  
August Increases

The average daily rate of mill consumption during August was about 18 percent above July and 6.7 percent below August 1950. Over the past 30 years the average gain in August over July has been 2.6 percent, but

July was abnormally low. The daily rate of consumption during August is normally about 5 to 9 percent lower than it is in September, October and November.

High economic activity sustained this high mill consumption. Overall industrial activity was up 2 percent in August over July. Personal income payments were estimated at an annual rate of 251.6 billion dollars in July. This was 0.1 percent above June and 13 percent above July last year.

#### Cotton Textiles Prices and Mill Margins Decline

Prices of cotton textiles have declined. The price index of cotton textiles decreased about 5 percent from June to July (see "Cotton Situation at a Glance"), and the average value of the 17 constructions of grey goods declined 8 percent from July to August. This fact, coupled with a somewhat smaller decline in raw cotton prices, has resulted in a decrease in mill margins. The average spread between the value of 17 constructions of cotton cloth obtainable from a pound of cotton and the price of the staple declined from 38.77 cents in July to 37.62 cents in August. It was 43.58 cents in August a year ago.

In line with these price and margin developments, the ratio of manufacturers' inventories of cotton textiles to sales rose from 2.73 in June to 2.81 in July, compared with 1.99 in July 1950.

#### July Exports 129.1 Thousand Bales; 1950-51 Total 4.1 Million Bales

July exports of cotton were 129.1 thousand bales, making a total for the 1950-51 crop year of 4.1 million bales, 29 percent less than during the 1949-50 season.

#### Exports from 1951 Crop Will Be Virtually Unrestricted

Quantitative restrictions on the export of cotton lint and cotton linters, which were in effect during the 1950-51 crop year, have been lifted. On September 17 the Department of Agriculture announced a general licensing program for cotton lint, which means that individual exporters will not be required to secure licenses. On September 10 open-end allocations were announced for cotton linters and linters pulp.

#### World Cotton Supply Estimated At 46.9 Million Bales in 1951-52

Based on the Bureau of Agricultural Economics' estimated of 1951 United States cotton production, and estimates of other countries' production by the International Cotton Advisory Committee, the world supply of cotton during 1951-52 will total 47 million bales. This is 7 percent more than last year's supply. If world consumption is approximately the same

as last year, 33.2 million bales, the world carry-over will be increased only about 2.9 million bales. The world carry-out stocks will be relatively small, less than a half year's disappearance at current rates of consumption.

### Spot Prices of Foreign Cotton

The spot prices of foreign growths showed only slight changes during August. However, prices of many of the growths were much lower by the first part of August than at their general peak during February. In the first week of September prices of most foreign growths increased slightly, although prices for Egyptian cotton fell more than 40 percent. Prices of selected foreign growths are shown in table 9.

#### Linters Price Decline

Continues; 2,290 Thousand

Bale Supply Expected

Paralleling the downward trend in cotton prices for the past two months, linters prices have also declined. Assuming linters production to be approximately 11 percent as large as the cotton crop, the supply of all grades during 1951-52 may be expected to total about 2,290 thousand bales. The August 1 carry-over was 287 thousand bales, about 165 thousand less than on August 1 a year ago.

The prices of Grades 2 and 4 linters at Memphis were quoted at 12.75 and 9.75 cents a pound, respectively, during the week of September 4. Prices of these grades were 13.72 and 10.53 cents during August; the peak price last season was 26 and 20.25 cents. In August a year ago these grades of linters sold at 14.20 and 10.93 cents per pound. Prices for all grades are shown in table 10.

#### Cottonseed Products Purchase

Program Announced

Details of the cottonseed products purchase program, to operate alongside the cottonseed price support and purchase program announced on June 1 were released August 17 by the Department of Agriculture. Crushers participating in the program must pay participating ginnerys and eligible producers not less than \$65.50 per ton for basis grade (100) cottonseed f.o.b. gin point, with specified premiums and discounts for other grades. Crushers, in turn, will be offered specified prices by the Commodity Credit Corporation for specified quantities of cottonseed products made from each ton of eligible cottonseed purchased from ginnerys and products, as follows:

Bureau of the Census.

1/ Includes 223,566 bales of the crop of 1951 ginned prior to August 1 which were counted in the supply for the season of 1950-51, compared with 283,243 and 297,843 bales of the crops of 1950 and 1949. No American-Egyptian and no Sea Island were ginned in any of the years.

The Statistics for 1951 in this report are preliminary and subject to revision when checked against the individual returns of the ginners being transmitted by mail.
